

iptables

In the recent minutes you recognized that you have some DDoS attacks in the transport layer. According to the below list, secure your server by iptables:

1- **Syn-flood attack:** In this attack system is floods with a series of SYN packets. Each packets causes system to issue a SYN-ACK responses. Then system waits for ACK that follows the SYN+ACK (3 way handshake). Since attack never sends back ACK again entire system resources get fulfilled aka backlog queue. Once the queue is full system will ignored incoming request from legitimate users for services.

2- Ping-of-Death and Smurf Attacks :

3- Malicious requests from IP:192.168.1.110 on Port:80 detected, block all his requests.

4- Set limit connections(120 connections) per source IP
